Breastfeeding

Published: January 29, 2015

Executive Summary

With a substantial development of research and findings for breastfeeding over the past three decades, we are now able to expand on the health benefits for both women and children across the globe. The two papers in this Series will describe past and current global trends of breastfeeding, its short and long-term health consequences for the mother and child, the impact of investment in breastfeeding, and the determinants of breastfeeding and the effectiveness of promotion interventions.

CDC Breastfeeding Report Card 2011 and 2018
Why Do We Want Baby Friendly Hospitals?

- Demonstrates a real investment (mostly time) in mother and infant outcomes
- Provides consistent care universally
- Promotes sustainment because following and responding to data
- Evidence-based method
Despite Improvements, Disparities Persist

South Carolina Urban, Academic Hospital
Despite a 27% increase in African-American mother breastfeeding initiation, African American mothers were still 2.4 times more likely to stop breastfeeding during birth hospitalization.

Rural Regional Medical Center
With option to choose Baby Friendly Practices, African American mothers were 1.8 times less likely to participate in >5 practices.

In multivariate regression model, Maternal Race, Rurality, and Education level were independently associated with choice of Baby Friendly Practices.

Lack of breastfeeding education and lack of access to breastfeeding support were identified as barriers to breastfeeding in focused interviews specifically in the African American, rural, and lower educated mothers.
Baby Friendly Work Group

- Meet at monthly BOI meeting for ~ 1 hour
- Measureable goals

- Priorities
  - All SC hospitals moving forward to Baby Friendly Designation
  - Address QI needs identified along the BF Pathway
  - Human milk for very low birth weight infants
All Hospitals Moving Forward Towards Baby Friendly

• At monthly meetings
  • Open invitation ALWAYS and introductions
  • Hospital questions regarding Baby Friendly prioritized

• Dissemination of information
  • Programs such as Best Fed Beginnings and EMPOWER
  • Low cost staff education opportunities- $45/nurse statewide
  • Incorporation of Safe Sleep into Baby Friendly education

• 2017 All Baby Friendly USA Designated Hospitals must also have policy to support employees/students
Who is Consistently at the Table?

• 5-7 hospitals represented by physician, nursing, lactation consultant, and/or administration
• SC DHEC
• SC WIC
• Nurse-Family Partners

• Others intermittently
  • La Leche League
  • PASOs (service for a healthy Latino community)
  • Industry
First Steps as a Pediatric Care Provider

• Create a breastfeeding friendly environment
  • Place for breastfeeding in the office
  • Educate staff

• Educate families (and staff)
  • Share a few facts
  • Consistency in education

• Check on breastfeeding mothers
  • Postnatal day 4 to day 14 is a difficult time to sustain

• Know community breastfeeding resources

### SC DHEC2017
What Do We Do?

• Pediatric healthcare providers did this for car safety
  • By 2000, for infants
    • Appropriately positioned car seats used for >90%
    • Reduced risk of fatal injury in a crash by 71%
    • In SC, now 13 deaths 2009-2015
      • Compared to 194 strangulation or suffocation in bed and 265 SIDS

• Time to Do the Same for Safe Sleep

• Educate
  • Prenatal or earlier
  • Universal and every visit
  • Audit to ensure
  • Focus specifically on middle of the night/exhausted decisions

---

National Highway & Traffic Safety
SC DHEC report, October 2016
Why is Safe Sleep important?
Because even one death is too many.

Safe Sleep
Safe Sleep focuses on actions you and others can take to help your baby sleep safely and to reduce your baby’s risk of dying while sleeping, which is called Sudden Unexpected Infant Death Syndrome (SUIDS).

The term “SUIDS” may sound scary, and the death of a baby is always heartbreaking. But there are a number of ways you can lower his or her risk while giving your baby the best care possible.

Learning about SUIDS and safe sleep for babies is important for all caregivers, not just for parents. Grandparents, aunts, uncles, babysitters, childcare providers and anyone else who might care for a baby also need to know about safe sleep.

The mission of the South Carolina Birth Outcomes Initiatives (SCBOI) Safe Sleep Initiative is to eliminate sleep-related infant deaths by providing prevention education and consistent messaging and support to healthcare providers, parents, caregivers and the community.

Simple, consistent actions can make a big difference in keeping your baby safe.

Can this really happen to me or someone I know?

The truth is in the numbers.
• South Carolina’s State Child Fatality Committee found 80 cases of infant deaths reviewed in 2017 were due to unsafe sleep.
• In these deaths, 65% of the babies who died were sleeping in an adult bed, couch or chair.
• For a South Carolina infant, a sleep-related death is 18 times more likely to occur than a motor vehicle-related death.
• According to the South Carolina Department of Health and Environmental Control (DHEC), SUIDs is the third leading cause of infant death in South Carolina.
• Putting a baby to sleep in the parents’ room, but on a separate surface, reduces the risk of sudden infant death syndrome by up to 50%.

Contact Information
For more information on the South Carolina Birth Outcomes Initiative, email scboi@scdhhs.gov or visit scdhhs.gov/boi.

Know and Share the ABCs of Safe Sleep

Babies are at risk of sleep-related deaths until they are a year old, and most deaths occur when babies are between 1 month and 4 months of age. However, if you follow these safety tips based on the American Academy of Pediatrics (AAP) recommendations, you can help prevent infant deaths due to unsafe sleep practices. Even one is just too many.

**Alone**

Babies should sleep alone in their own safe sleep space such as a crib, bassinet or playard with a firm, flat mattress. Sleeping alone means no other people, pets or objects are in the same sleep area.

This means all toys, soft objects, bumper pads, blankets and pillows need to be removed from a baby’s crib. These items are choking and suffocation hazards. Also, never lay a baby down on adult beds, chairs, sofas, waterbeds, air mattresses, pillows or cushions.

**Back**

Always put your baby to sleep on his back, both for naps and at night. Placing babies on their backs to sleep is one of the most important ways to prevent sudden unexpected infant death (SUID). Often a baby is put to sleep safely at first, but then is moved to an unsafe sleep position after awakening in the night.

**Crib**

A crib, bassinet or playard is safer than having a baby sleep next to you in bed. But what’s just as important is making sure the crib or bassinet is safety approved by the Consumer Products Safety Commission and that the crib is bare.

**Additional Safety Tips**

Here are some safety tips to remember.

- **Do not use cribs made before 2011.** Older cribs may not meet current safety standards.
- **Do not use altered cribs.** Cribs that are broken or modified, or that have gaps larger than two fingers between the sides of the crib and the mattress can be dangerous.
- **Use a firm mattress.** Make sure the sleep surface, such as a mattress, of the crib or bassinet is firm.
- **Share a room, not a bed.** A crib or bassinet near your bed can make it easy to reach your baby so you can easily breastfeed and bond with the baby. This is safer than risking falling asleep with a baby in bed with you.
- **Keep sleeping space away from cords.** Do not place a crib or bassinet near a window with blinds, curtain cords or baby monitor cords, as babies can strangle on these items.
- **Set a timer.** When feeding your baby, set an alarm or timer on your phone to ensure you stay awake.
- **No objects in sleeping space.** Remove all bumper pads, blankets, toys, pillows and other objects from the baby’s crib or bassinet.
